Autocorrelated Standard Deviation

R Project for Statistical Computing

September 1, 2013

Abstract

The fact that many hedge fund returns exhibit extraordinary levels of serial correlation is now well-known and generally accepted as fact. Because hedge fund strategies have exceptionally high autocorrelations in reported returns and this is taken as evidence of return smoothing, we highlight the effect autocorrelation has on volatility which is hazed by the square root of time rule used in the industry

1 Methodology

Given a sample of historical returns $(R_1, R_2, ..., R_T)$, the method assumes the fund manager smooths returns in the following manner, when 't' is the unit time interval:

$$\sigma_T = T\sqrt{\sigma_t} \tag{1}$$

2 Usage

In this example we use edhec database, to compute true Hedge Fund Returns.

- > library(PerformanceAnalytics)
- > data(edhec)
- > ACFVol = ACStdDev.annualized(edhec[,1:3])
- > Vol = StdDev.annualized(edhec[,1:3])
- > Vol

ACF and Orignal Volatility

The above figure shows the behaviour of the distribution tending to a normal IID distribution. For comparitive purpose, one can observe the change in the characteristics of return as compared to the original.
